

**Figure 1**

Figure 1 consists of two panels, (a) and (b), showing the relationship between the number of trials ( $N$ ) and the standard error of the mean (SEM). Panel (a) shows SEM on the y-axis (ranging from 0 to 1.0) against  $N$  on the x-axis (ranging from 0 to 100). The curve starts at approximately 1.0 for  $N=0$  and decreases as  $N$  increases, reaching about 0.3 at  $N=100$ . Panel (b) shows SEM on the y-axis (ranging from 0 to 1.0) against  $N$  on the x-axis (ranging from 0 to 100). The curve starts at approximately 1.0 for  $N=0$  and decreases as  $N$  increases, reaching about 0.3 at  $N=100$ .
